

## 32\_MBX-50-0-3

- [1] The pull-in range depends on the geometry of the PCB connector (size of lead-in).
- [2] If the misalignment between the PCB connectors is bigger then the specified tolerance for the connecting range, a "blind" assembly process of the two PCB's is no longer possible.

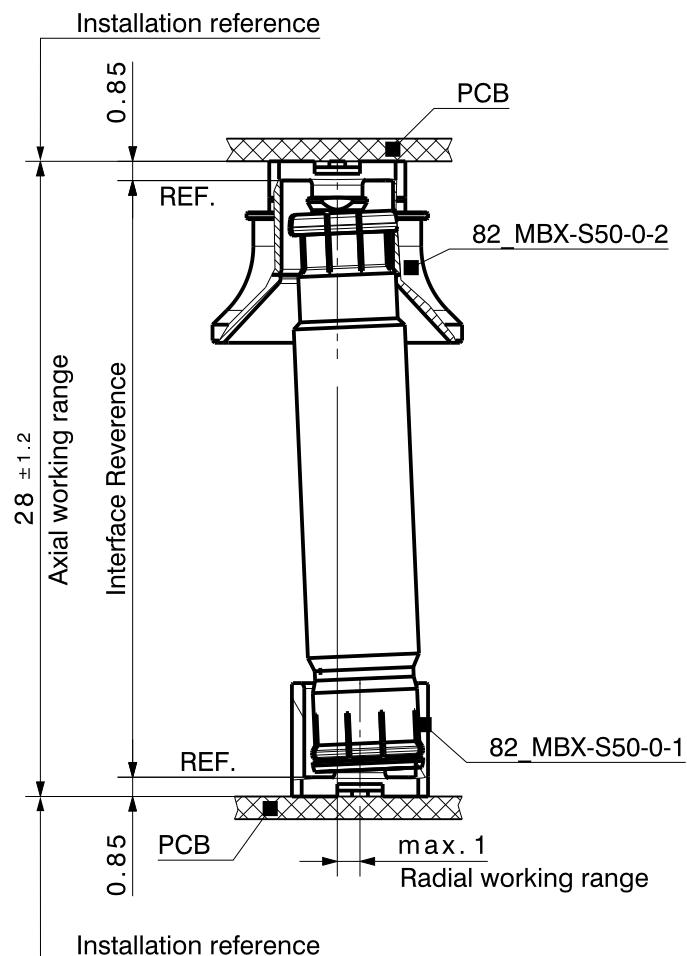

### Connecting range

The connecting range is the maximum misalignment which allows a trouble-free connection with the counter PCB (blind mate, including maximum swiveling angle of adaptor)

### Radial and axial working range

The radial and axial working range is the maximum misalignment that allows a sufficient electrical and mechanical connection
